

PROTOTYPE STAMPING TOOL

Aim of the project:

- ☞ *Machining of a blanking tool for prototypes using only milling technology*

Why?

- ☞ *Because milling it's **faster** than other technologies like EDM*
- ☞ *5 axis milling can create **complex geometry***
- ☞ *Avoid **set up** between different machines*

Main goals

- ☞ *Blanking tool requires high accuracy due to the low tollerances of mechanical couplings*
- ☞ *Blanking tool prototypes need to be **modifiable** during prototype tests*
- ☞ *Blanking tool prototypes need to be precise because they need to give the client a workpiece with the same tollerances as the final one*

MODIFIABLE

What does it means?

During the initial stages a prototype is subject to many changes that requires a lot of corrections on the blanking-stamping tool
